

# WHITE BALANCE DISC

FOR QUICK AND ACCURATE WHITE BALANCE

The Vello White Balance Disc is ideal for setting precise custom white balance for photo and video, resulting in images with consistent and accurate color. It works with any digital camera and can be used to set a custom white balance in-camera or later in post production.

## Directions for Setting “In-Camera” Custom White Balance

1. Set the camera's lens to “manual focus.”
2. Set the desired exposure for your shot, or choose one of the auto exposure modes.
3. Simply hold the filter in front of the lens as shown, and aim the camera so that the same light that will be illuminating your subject passes through the disc.

*Tip: Stand where your subject is, and point the camera back to the location where you will be shooting from.*

4. Use the menus in your camera to set the white balance to “custom.” Choose the image that you just shot through the disc as the reference for the custom white balance.

You may need to refer to your camera's manual for the specific steps to perform this task, as it varies between manufacturers and models.

*Note: you MUST make a new WB reference each time the lighting conditions or the camera settings change.*
